

Problem statement

How to make your app lovable:

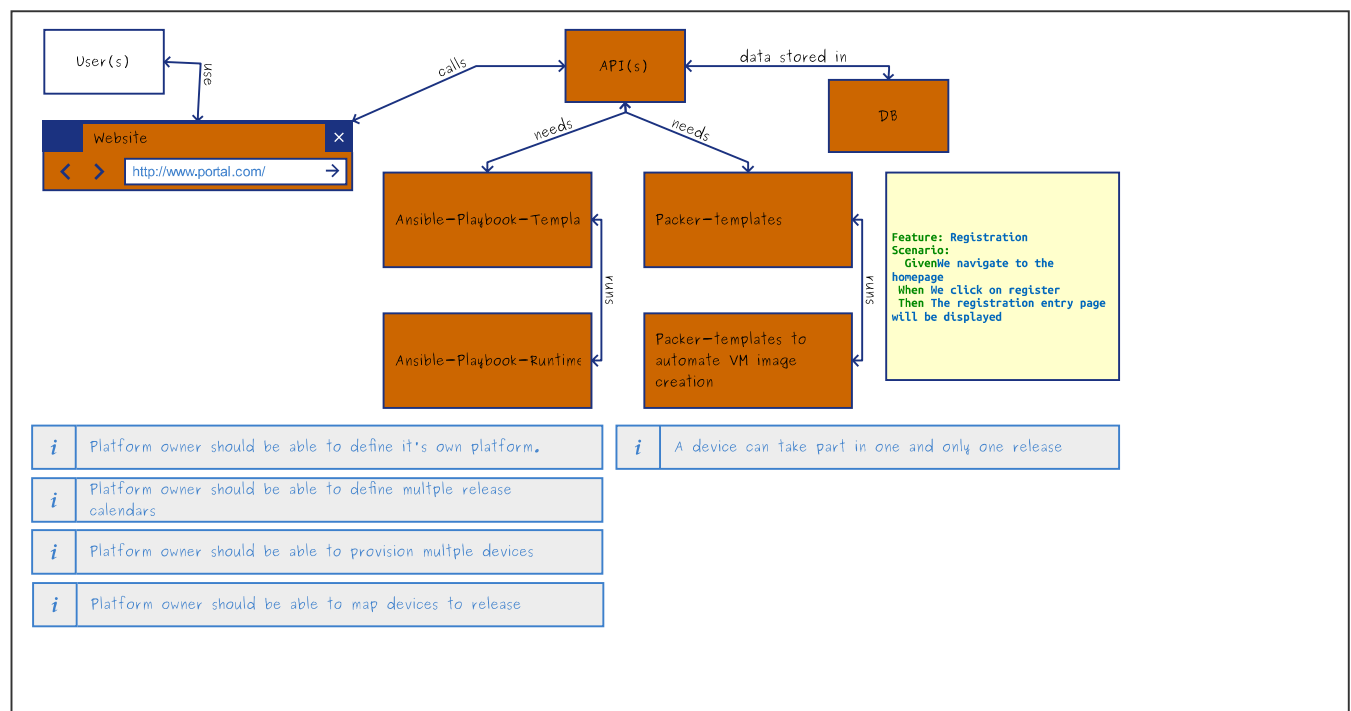

A decent app helps you get the job done.
A good app helps you get it done faster.
A great app, however, makes it effortless.

✕ In today's world every company goes thru development and deployment processes. These processes are simple to begin but as business grows they get very complex and becomes un-managable. The business, development and deployment teams struggle to get the products out in the hands of end users and they try their best. Their efforts become problems and slow down the entire system of delivering business values where we can monetize features and products.

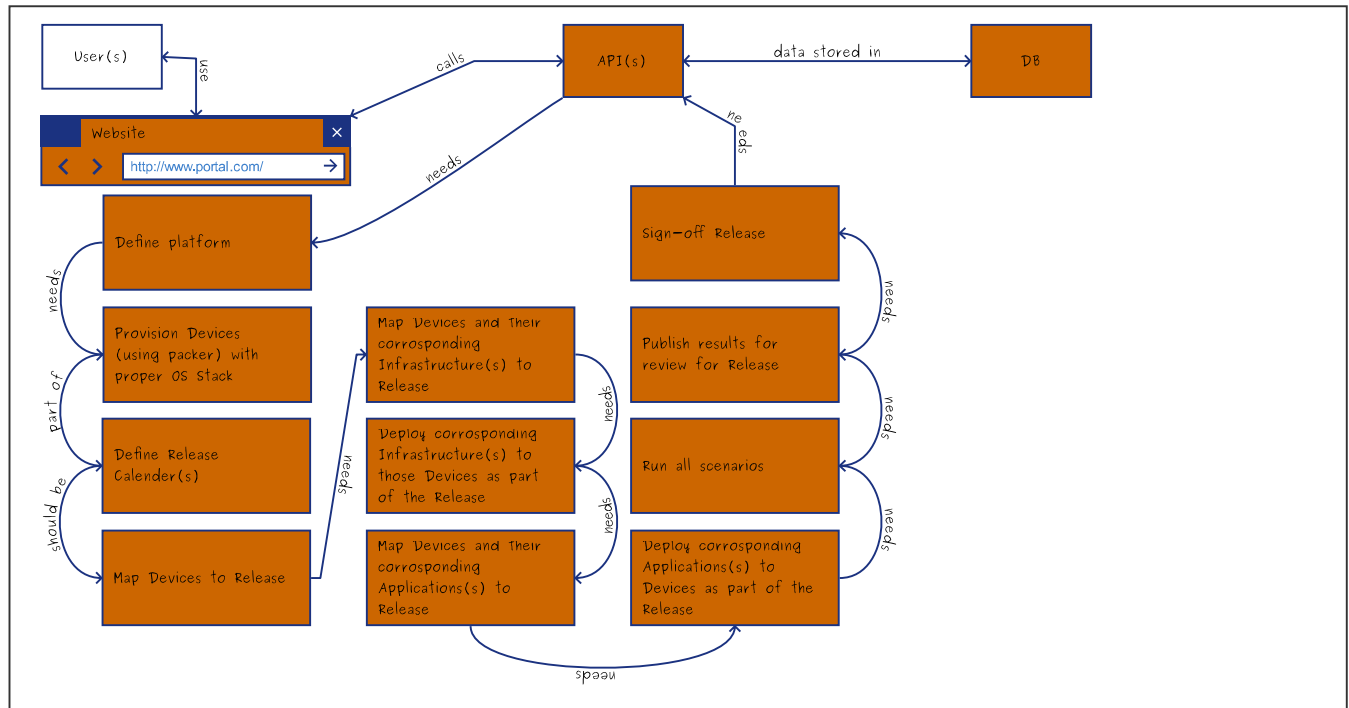

✕ The solution is to provide a single portal to manage all these difficulties. The portal will manage all the hardwork that goes at the back irrespective of application, infrastructure and hypervised environment. The portal is effortless.

- ^ Manage entire platform where applications can live (either isolated or together)
- ^ Manage all the devices that are hosted under the platform
- ^ Create and manage release calendars for given platform
- ^ Manage infrastructure and applications that are part of release
- ^ Create mapping between release and devices that are hosting the release
